

# Example: Task 3.1.1 Planning Data Specification

This paper specifies the planning data for WTSM. While it is written in the context of the base year 2001, these same items will be required in the future year projections.

## Zones

All data are required for the revised model zone system.

## Years

Planning data is required for 2001, 2006, 2011, 2016 and 2021.

## Population, Households and Workforce<sup>1</sup>

There are 3 non-overlapping definitions of 'usually resident' population:

- residents in private households
- institutional residents (ie non-private households)
- overseas visitors

Overseas visitors will be ignored.

All the following data should be produced relating to the population in private households – because this is what we have surveyed.

It would be useful to have the same breakdown for the institutional population but, if this involves any real additional complexity, then we would be content with some less detailed information on institutional populations.

The segmentation required is as follows.

Population classified into:

- infant, age<5
- child, age 5-10 (primary school age)
- child, 11-16
- young adult, age 17-25, in full-time employment
- young adult, age 17-25, in part-time employment
- young adult, age 17-25, other
- adult, age 26-65, in full-time employment
- adult, age 26-65, in part-time employment
- adult, age 26-65, other
- other adult, age >65 in full-time employment
- other adult, age >65 in part-time employment
- other adult, age >65, other

---

<sup>1</sup> ie Employed persons by place of residence.

It will be necessary to agree the appropriate definitions of full and part time employment.

Households classified into:

- 1 adult, full or part time employed
- 1 adult, other
- 2 adults, one or more full or part time employed
- 2 adults, other
- 3+ adults

Adults are persons aged 17 or more.

### **Employment (by workplace)**

A useful segmentation would be, broadly:

- retail
- manufacturing
- transport & communications
- services
- other

### **School Enrolments**

The segmentation would be:

- primary
- secondary
- tertiary
